## Introduction

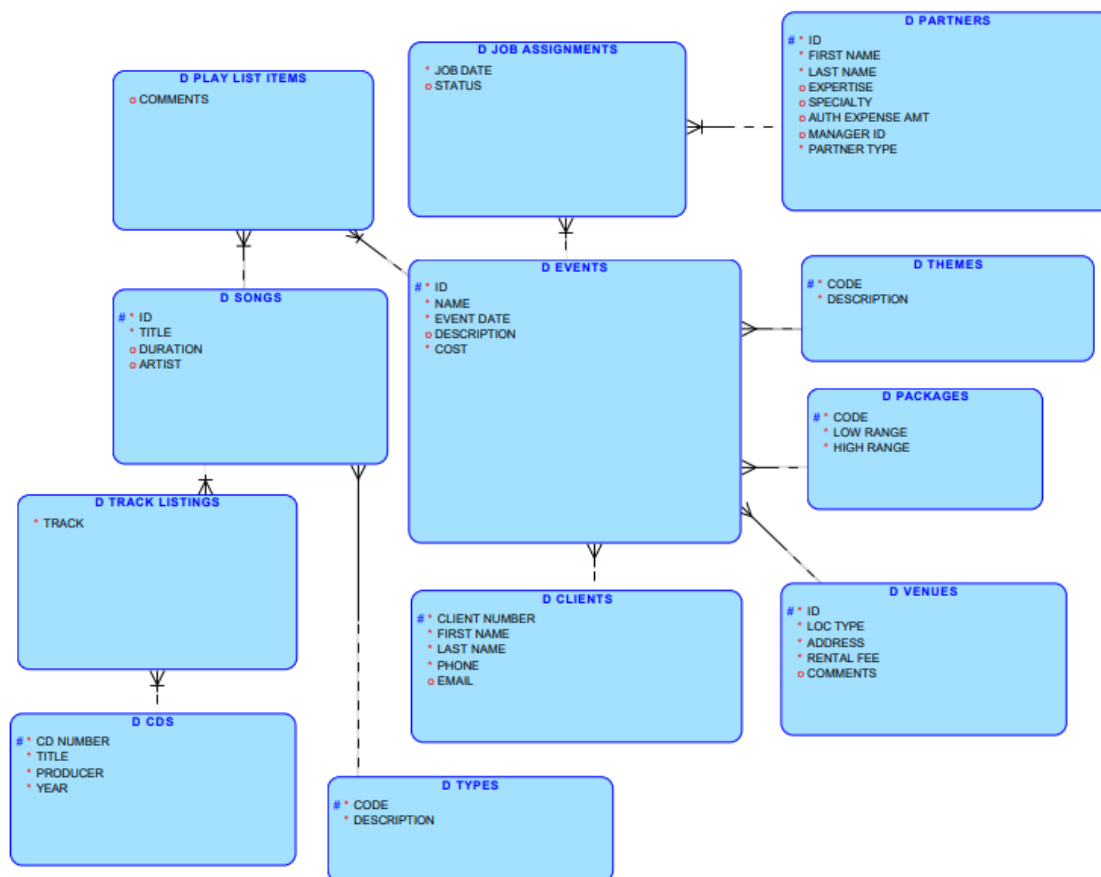

Within an organization, ERD's play a very important role as they can give you an understanding of a database simply by looking at a picture. Within SQL data modeler, there is a feature called reverse engineer that will allow you to not only generate a diagram from DDL but also to generate DDL from a diagram.

## Chinook Schema Diagram

Below is a link to a PDF file that contains the ERD diagram for the Chinook Schema.

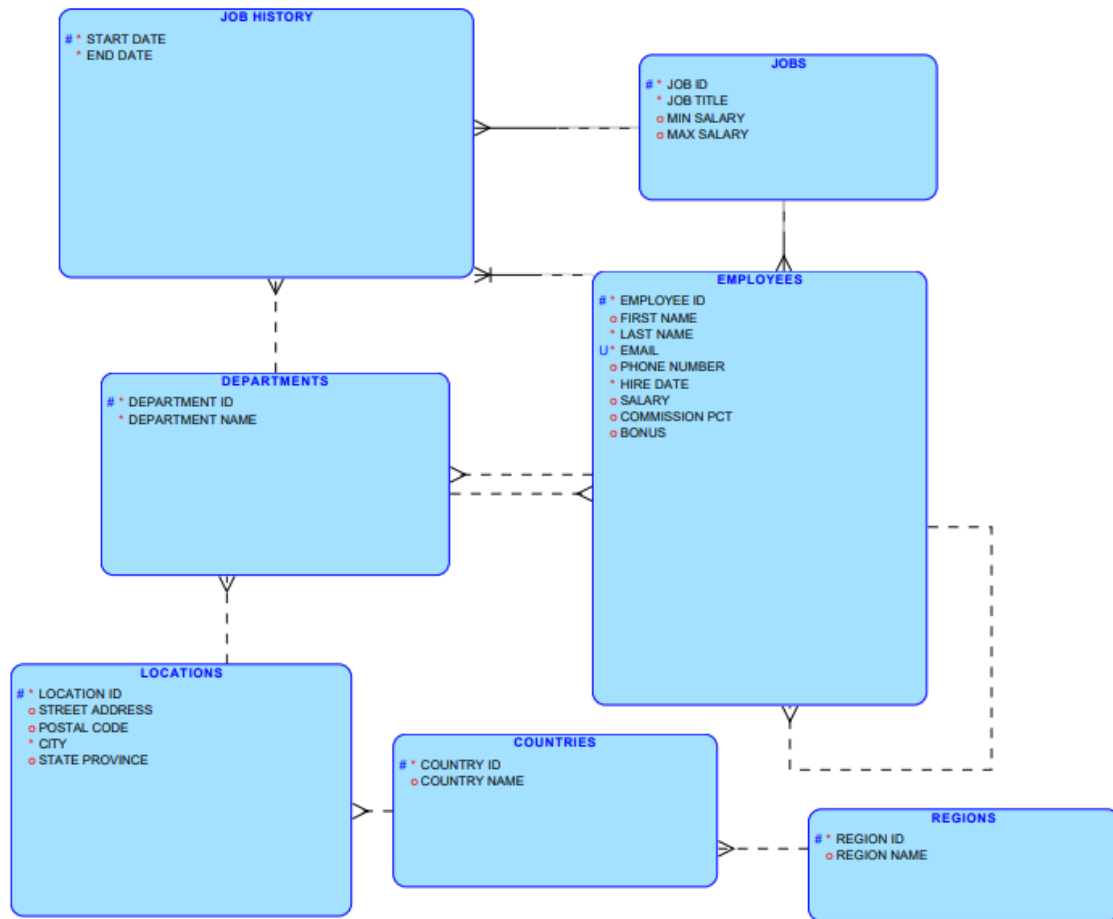

The screen below shows a screen shot of the logical model

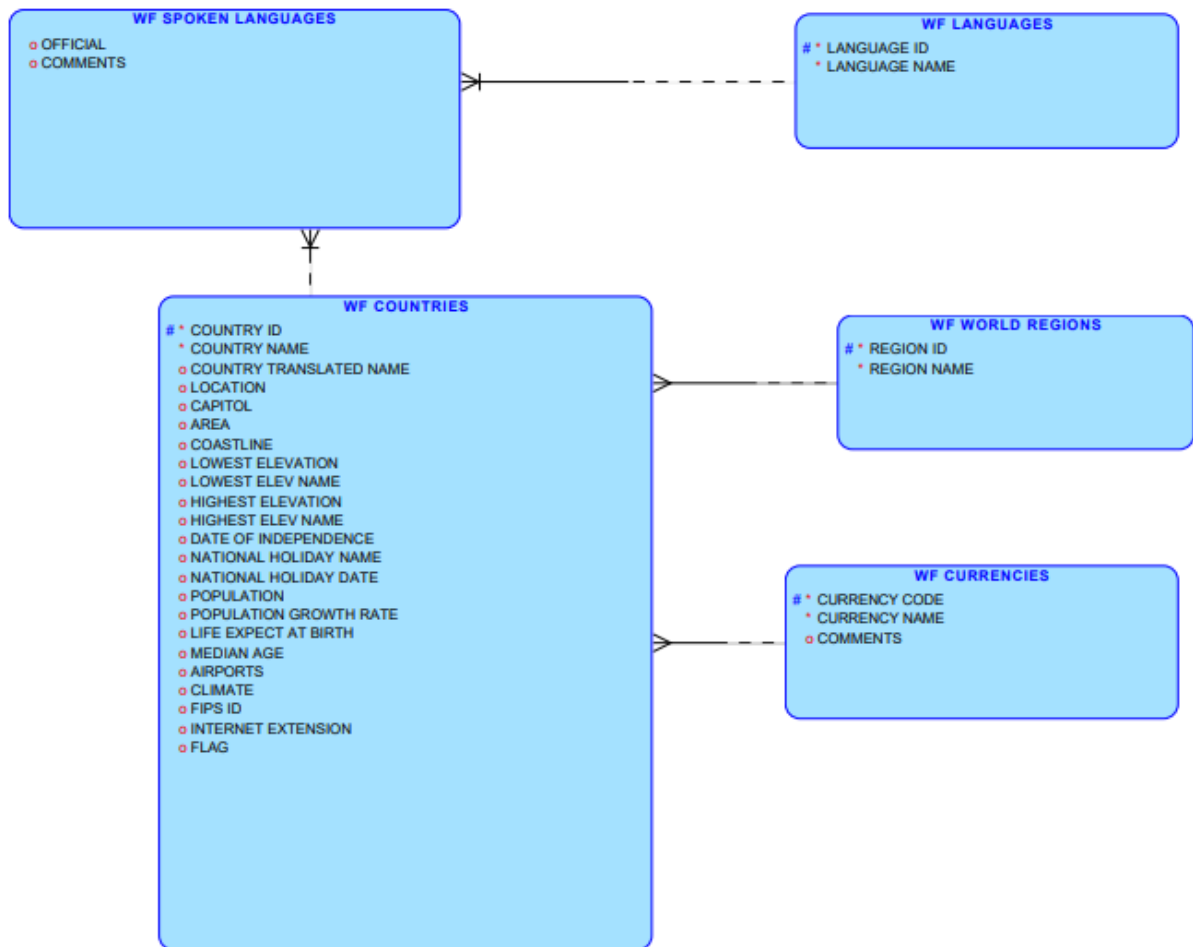

Below is another screen shot of the logical model for the Chinook schema.

## ERD DIAGRAM FOR ENVIRONMENT SETUP

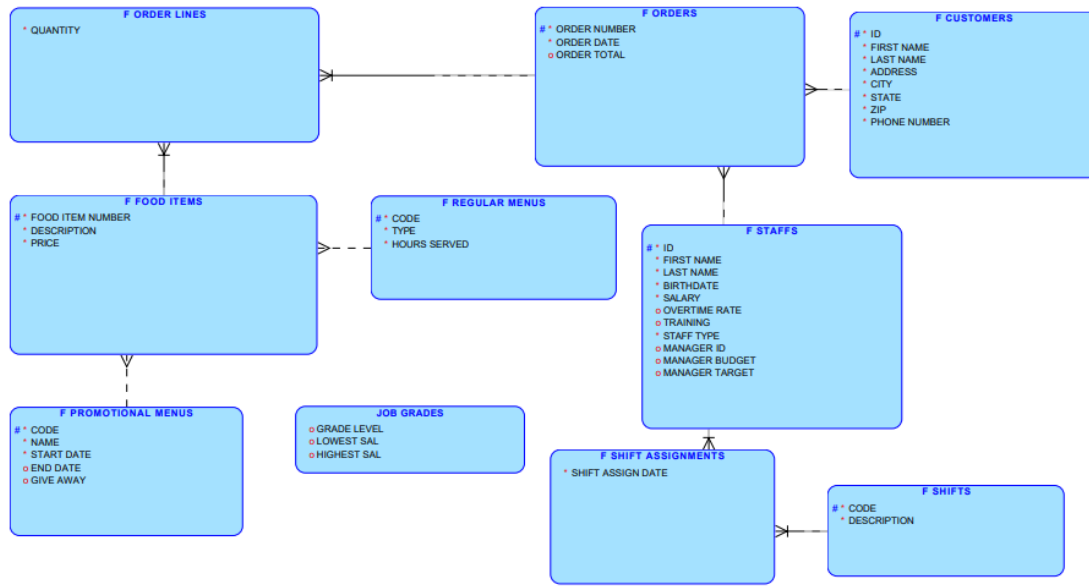

Within the Chinook schema there are many groups of tables since they all don't connect using the same primary or foreign keys.

## ERD DIAGRAM FOR ENVIRONMENT SETUP

There is a table below that doesn't really connect to any other tables.

## ERD DIAGRAM FOR ENVIRONMENT SETUP

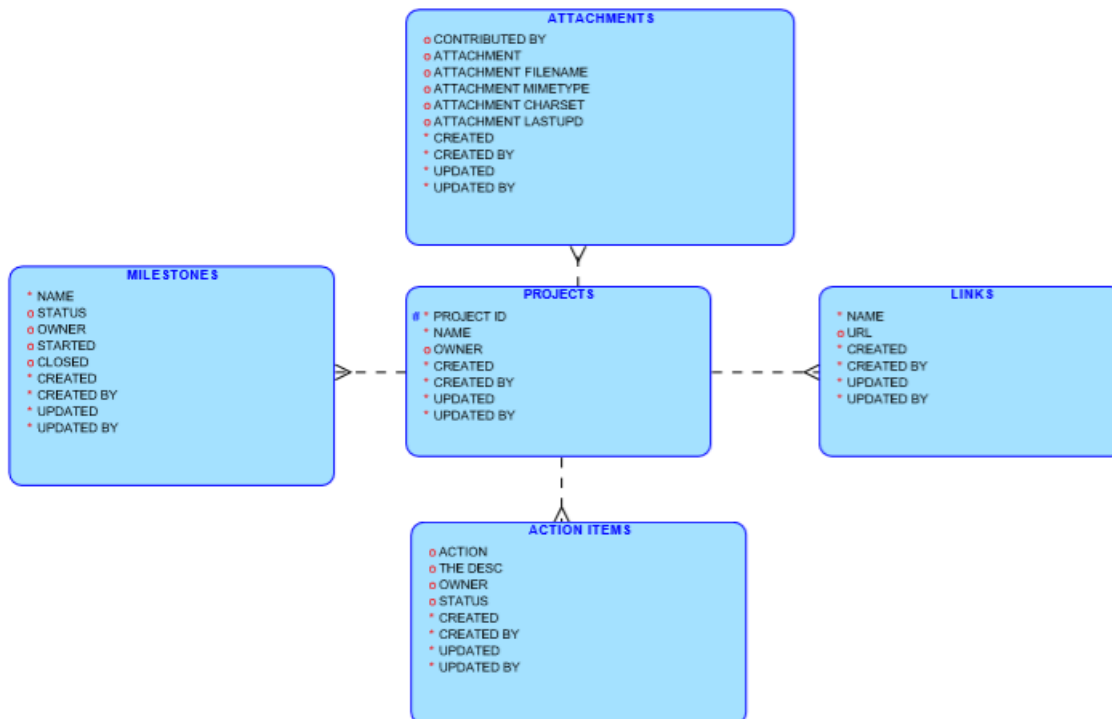

## Chinook2 Schema Diagram

Below is a second PDF that contains the diagram for the second schema.

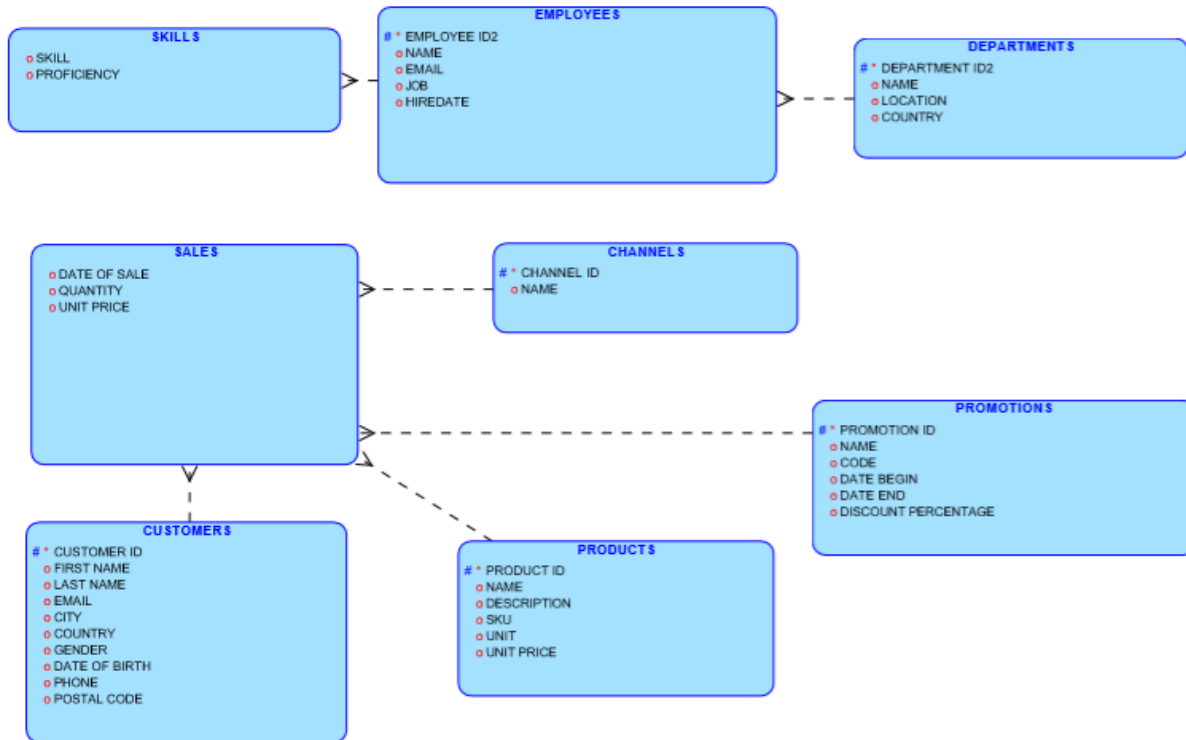

ERD\_DiagramChinook2.pdf

The second schema is divided into three table groups.

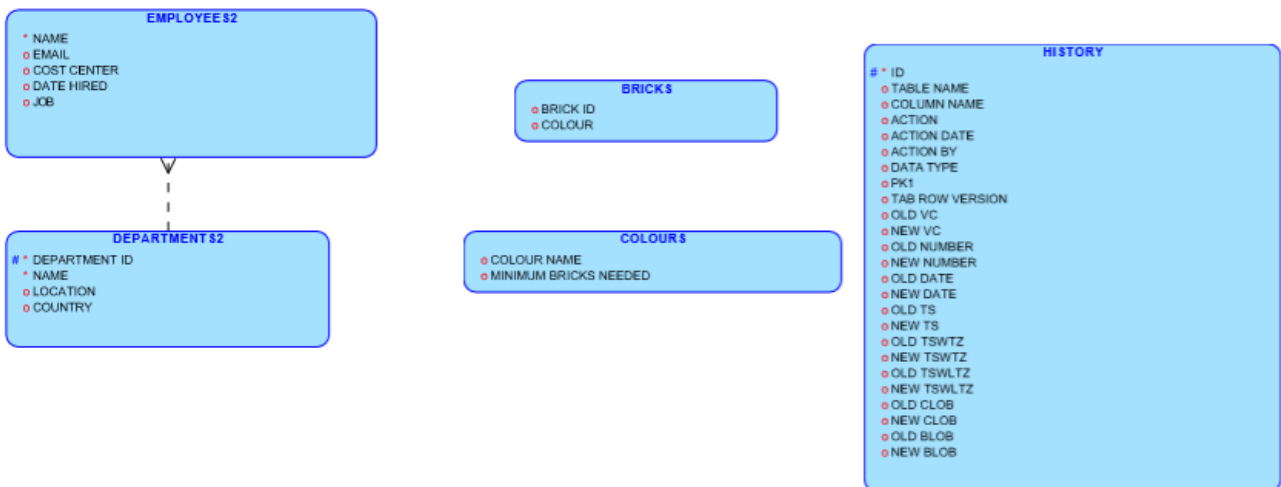

## ERD DIAGRAM FOR ENVIRONMENT SETUP

Below is the second table group.

Below is the third table group. As you can see 3 tables are not connected to any of the others.

## Conclusion

ERD diagrams are a crucial part to managing a database and as a DBA you need to know how to use modeling tools such as SQL Data Modeler. Data modeler is a very powerful tool that can be used to not only generate ERD diagrams but your ERD diagrams can be used to generate DDL.
